O&O SpeedCheck is a utility designed to simulate the reading process performed by the operating system to process the fragments of files on a hard disk. It will simulate the reading process by simulating the creation of the virtual file and then by performing a series of reads and writes to the file. The test is run five times and the result is detailed in the result table. Each test is executed in two different states: fragmented and defragmented. The simulation process consists of the following steps: 1. Opening the virtual file (RAM File). 2. The first read. 3. The second read. 4. The third read. 5. The fourth read. 6. A first write. 7. A second write. 8. The second simulation (defragment) 9. A third read. 10. A fourth read. 11. The final simulation (fragmentation) 12. A last read. 13. The final simulation (defragmentation) 14. A final write Verification: After a single execution of the utility, the result will be saved for future use. Note: Currently available only for Windows 7. Other versions will be added soon.
