**DevOps: Why Kubernetes is the Most Important Technology This Year** Since its inception in the 2014, Kubernetes has become the de facto standard of application container technology. Having gained the momentum since it was introduced by Docker Inc. last year, Kubernetes has been the container manager of choice for most of the Fortune 500, as well as for startups and companies of every size. Kubernetes is one of the most prevalent container technologies on the market today, and will continue to grow in popularity as developers worldwide begin exploring the benefits of adopting it. “As an Open Source community, it is a non-issue because all Kubernetes users can run their own cluster in their lab environments, and if not within a private network that’s as secure as they want it to be,” says Jeremy Huddleston, Cloud Guru at Fox Content Network. “This is the ultimate distributed/collaborative environment, and it is good for about anything.” Kubernetes is a cluster management system that helps streamline the management of containers, whether you are doing virtualization or containerization. No matter the type of platform you are using, Kubernetes makes it easy to set up or spin up new containers, and it also makes sure those containers run in isolation, even when others are running on the same host. When you need a container to run, Kubernetes matches you up with available server resources and creates, or spins up, the container on the servers you are requesting. Kubernetes also keeps track of your containers, and does a great job of notifying you if your containers are running out of resources or become unreachable for any reason. “Kubernetes allows any application to run in containers, and provides services through a set of APIs.” In addition to providing these advanced services, Kubernetes also allows any application to run
